-!- FUNCTION: Converts lysophosphatidic acid (LPA) into phosphatidic aidlaintivil
16-OCT-2001 (Rel. 40, Last sequence update)
15-MAR-2004 (Rel. 43, Last annotation update)
1-acyl-sn-glycerol-3-phosphate acyltransferase delta (EC 2.3.1.51) (1-AGP acyltransferase 4) (1-AGPAT 4) (Lysophosphatidic acid acyltransferase-delta) (LPAAT-delta) (1-acylglycerol-3-phosphate O-acyltransferase 4).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Structure and functions of lysophosphatidic acid acyltransferases."; Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.

    similarity).
    -!- CATALYTIC ACTIVITY: Acyl-CoA + 1-acyl-sn-glycerol 3-phosphate
    COA + 1,2-diacyl-sn-glycerol 3-phosphate.
    -!- PATHWAY: De novo phospholipid biosynthesis; second step.
    -!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
    -!- SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate acyltransferase family.

                                                                                                                                                                                                                                                                                                                                    Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

CATALYTIC ACTIVITY: Acyl-CoA + 1-acyl-sn-glycerol 3-phosphate
CoA + 1,2-diacyl-sn-glycerol 3-phosphate.
PATHWAY: De novo phospholipid biosynthesis; second step.
SUBCELLULAR LOCATION: Integral membrane protein (Potential).
SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate
                                                                                                                                                               28-FEB-2003 (Rel. 41, Created)

Submitted (FBB-2000) to the EMBL/GenBank/DDBJ databases. and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Converts lysophosphatidic acid (LPA) into phosphatidic acid by incorporating acyl moiety at the 2 position (By similarity).

-!- CATALYTIC ACTIVITY: Acyl-CoA + 1-acyl-sn-glycerol 3-phosphate = COA + 1,2-diacyl-sn-glycerol 3-phosphate.
-!- PATHWAY: De novo phospholipid biosynthesis; second step.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate Wambutt R., Korn B., Klein M., Poustka A.; "Towards a catalog of human genes and proteins: sequencing and analysis of 500 novel complete protein coding human cDNAs."; Genome Res. 11:422-435(2001). -:- CAA + 1,2-diacyl-sn-glycerol 3-phosphate.
-:- PATHWAY: De novo phospholipid biosynthesis; second step.
-:- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-:- SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate acyltransferase family.
-:- CAUTION: It is uncertain whether Met-1 or Met-12 is the initiator.

                                                                                                                                                                              Andre B., Cziepluch C., Hein C., Jauniaux J.-C., Urrestarazu A., Vissers S., Vissers S., Submitted (AUG-1994) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate acyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         72;

-!- FUNCTION: May be an acyltransferase with an altered substrate specificity that enables it to use a C-26-CoA in place of the C-16 or C-18-CoAs used by the wild type protein.

-!- CATALYTIC ACTIVITY: Acyl-CoA + 1-acyl-sn-glycerol 3-phosphate CoA + 1,2-diacyl-sn-glycerol 3-phosphate.

-!- PATHWAY: De novo phospholipid biosynthesis; second step.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate acyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               44 Q -> L (IN ALLELE SUPPRESSOR SLC1-1).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "THE COMPLETE GROWE SEQUENCE OF ESCHETICHIA COLI K-12.";
Science 277:1453-1474(1997)
-!- FUNCTION: CONVERTS LYSOPHOSPHATIDIC ACID (LPA) INTO PHOSPHATIDIC
ACID BY INCORPORATING ACYL MOIETY AT THE 2 POSITION. THIS ENZYME
CAN UTILIZE BITHER ACYL-COA OR ACYL-ACYL CARRIER PROTEIN AS THE
FATTY ACYL DONOR.
-!- CATALYTIC ACTIVITY: Acyl-COA + 1-acyl-sn-glycerol 3-phosphate.
-!- PATHWAY: De novo phospholipid biosynthesis; second step.
-!- PATHWAY: De novo phospholipid biosynthesis; second step.
-!- SUBCELLULAR LOCATION: Inner membrane-associated.
-!- SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate
                                         01-AUG-1992 (Rel. 23, Created)
01-AUG-1992 (Rel. 23, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
1-acyl-sn-glycerol-3-phosphate acyltransferase (EC 2.3.1.51) (1-AGP
acyltransferase) (1-AGPAT) (Lysophosphatidic acid acyltransferase)

CoA + 1,2-diacyl-sn-glycerol 3-phosphate.
PATHWAY: De novo phospholipid biosynthesis; second step.
SUBCELLULAR LOCATION: Inner membrane-associated.
SIMILARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta,

"Lysophosphatidic acid at the sn-2 position of triacylglycerol in
transgenic rapesed oil.",
Plant Physiol. 109:1389-1394(1995).
-!- FUNCTION: Converts lysophosphatidic acid (LPA) into phosphatidic
acid by incorporating acyl moiety at the 2 position. This enzyme
uses eruccyl-CoA as an acyl donor.
-!- CATALYTIC ACTIVITY: Acyl-CoA + 1.acyl-sn-glycerol 3-phosphate =
CoA + 1,2-diacyl-sn-glycerol 3-phosphate.
-!- PATHWAY: De novo phospholipid biosynthesis; second step.
-!- SIMBCELULAR LOCATION: Integral membrane protein (Potential).
-!- SIMBLARITY: Belongs to the 1-acyl-sn-glycerol-3-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      77; Gaps

Plant Mol. Brol. 29:267-278(1995)

L. Plant Mol. Biol. 29:267-278(1995)

L. FUNCTION: Converts lysophosphatidic acid (LPA) into phosphatidic acid by incorporating acyl moiety at the 2 position. This enzyme uses erucoyl-CoA as an acyl donor.

CATALYTIC ACTIVITY: Acyl-CoA + 1-acyl-sn-glycerol 3-phosphate = CoA + 1,2-diacyl-sn-glycerol 3-phosphate.

COA + 1,2-diacyl-sn-glycerol 3-phosphate.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

probable membrane protein YBR042c - yeast (Saccharomyces cerevisiae)

N;Alternate names: hypothetical protein YBR0412
C;Species: Saccharomyces cerevisiae
C;Date: 26-Aug-1994 #sequence_revision 09-Sep-1994 #text_change 19-Apr-2002
C;Accession: 845900
R;Andre, B.; Cziegluch, C.; Hein, C.; Jauniaux, J.C.; Urrestarazu, A.; Vissers, S.
Submitted to the Protein Sequence Database, August 1994
A;Reference number: 845893
A;Accession: 845800
A;Recence number: 845893
A;Accession: 845800
A;Recence number: 845893
A;Accession: 845800

Patent No. 294523

GENERAL INFORMATION:
APPLICANT: SLABAS, ANTONI R.
APPLICANT: BROWN, ADRIAN P.
TITLE OF INVENTION:
DEPARTMENT OF INVENTION:
ADDRESSE: STERNE, KESSLER, GOLDSTEIN & FOX, P.L.L.C.
STREET: 1100 NEW YORK AVENUE, NW, SUITE 600
CITY: WASHINGTON NEW YORK AVENUE, NW, SUITE 600
CITY: WASHINGTON NEW PORM:
NEDIUM TYPE: Ploppy disk
COMPUTER: IBW PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Petentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/941,319
FILING DATE: 10-DEC-1993
ATTORNEY/AGENT INFORMATION:
PREFERENCE/DOCKET NUMBER: 0623.0310000/JAG/GER

New nucleic acid fragment encoding a lysophosphatidic acid acetyltransferase (LPAAT) isozyme, useful for creating transgenic plants which encode LPAAT at higher or lower levels than normal.

Claim 31; Page 99-100; 102pp; English.

The present sequence represents a lysophosphatidic acid acetyltransferase (LPAAT) isoenzyme. The nucleic acid may be used to create transgenic plants which encode LPAAT at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. This would have the effect of altering the level of specific triacylglycerols in those cells, for e.g. overexpression of an LPAAT similar to the maize LPAAT will result in higher oil content in the seed, stem and leaf. LPAAT chimeric genes may be used for co-suppression of genes encoding LPAAT. The polynucleotides may also be used as probes for genetically and physically mapping the genes that are a part of, and as markers for traits linked to those genes

The invention relates to nucleic acids encoding novel plant
acyltransferase-like proteins (AAA37343-A37445) which comprise one of 8
conserved acyltransferase motifs (AAY99474-Y99481). Acyltransferases
Catalyse the transfer of acyl groups from a donor to a variety of
substrates such as glycerides, sterols, stanols and phosphatides. Such
caralyse the transfer of acyl groups from a donor to a variety of
substrates such as glycerides, sterols, stanols and phosphatides. Such
characteristics of the plant. For example, cold-hardened plants have
different lipid concentrations in the cell membrane compared to non-
hardened plants, which makes the membrane more fluid and the plant more
can be used as probes or for expressing acyltransferase-like proteins in
host cells e.g., for recombinant protein production. They may be
expressed in plant cells to alter the lipid composition of the plant
e.g., for the production of chill-resistant plants, or for altering the
composition of plant oils. The present sequence represents jojoba
lysophosphatidic acid acyltransferase (LPAAT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120 SSKFLPVIGWSMWFSEYLFLERSWAKDESTLKLGLQRLKDYPLPFWLALFVEGTRFTQAK

The invention relates to nucleic acids encoding novel plant

CC acyltransferase-like proteins (AAA37343-A37445) which comprise one of 8

CC conserved acyltransferase motifs (AAY99474-Y99481). Acyltransferases

CC catalyse the transfer of acyl groups from a donor to a variety of

CC substrates such as glycerides, sterols, stanols and phosphatides. Such

CC characteristics of the plant. For example, cold-hardened plants have

CC different lipid concentrations in the cell membrane compared to non-

CC different lipid concentrations in the cell membrane and the plant more

CC different lipid concentrations in the cell membrane of the plant wore

CC different lipid concentrations in the cell membrane for acid sequences of the invention

CC colerant of low temperatures. The nucleic acid sequences of the invention

CC can be used as probes or for expressing acyltransferase-like proteins in

CC can be used as probes or for expressing acyltransferase-like proteins in

CC composition of plant cells to alter the lipid composition of the plant

CC composition of plant oils. Sequences AAY99463-Y99473 represent cDNAs

CC and lysophosphatidic acid acyltransferases ATATI-ATAT4, ATAT6-ATAT11
                                                                                                                                                                                                                                                                Novel acyltransferase related proteins useful for altering membrane fluidity in plant cells e.g. to induce chill tolerance.
                                                                                                                                                                                                                                                                                                                                      Example 5; Page 75-76; 126pp; English

                                        The amino acid sequence (AAR99249) was deduced of Limnanthes clone 1 (AAT35205), a cDNA clone obtd. by heterologous screening of a Limnanthes douglasii seed cDNA library using a 600 bp Ncol/PstI fragment of a rape 2-acyltransferase (2AT) clone corresponding to the N-terminus of the rape protein. Another isolated clone (AAT35204) codes for Limnanthes 2AT (AAR99248), which can be used to increase the erucic acid content of transgenic plants
                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

```

Complementation studies using a maize cDNA library transferred into E. coli UC201 allowed the isolation of a plasmid encoding a 2-acyltransferase enzyme from maize. DNA encoding 2-acyltransferase can be used to produce transgenic plants having altered lipid contents. (Updated on 25-MAR-2003 to correct PN field.) Novel isolated human isoform of lysophosphatidic acid acyltransferase-epsilon useful for diagnostic, therapeutic and screening purposes.

Example 1; Fig 2; 48pp; English.

The sequence represents a maize lysophosphatidic acid acyltransferase (LPAAT) isoform, LPAAT-delta, similar to a human LPAAT isoform, LPAAT
C (PAAT) isoform, LPAAT-delta, similar to a human LPAAT isoform, LPAAT
C (PSI)on. LPAAT catalyses the acylation of lysophosphatidic acid (LPA) to phosphatidic acid (PA). LPA and PA have been identified as phospholipid signalling molecules that affect a wide range of biological responses. PA is involved in cellular activation and mitogenesis. Compounds that block PA generation and hence diminish lipid biosynthesis and the signal involved in cell activation are of therapeutic interest in the areas of inflammation and oncology (e.g. autoimmune diseases and cancer) as well continity of LPAAT-epsilon and its corresponding DNA can be used activity of LPAAT and, therefore, PA. The DNA is useful in tests to detect the presence or expression of LPAAT-epsilon in relation to certain diseases and conditions, and in disease prevention and treatment. The sequences of the invention are also useful for diagnosis of diseases and conditions in which the expression of LPAAT enzyme is abnormal

LPAAT also referred as 1-acyl sn-glycerol-3- phosphate acyltransferase (EC 2.3.1.51), catalyses the acylation of lysophosphatidic acid (LPA) to phosphatidic acid (PA). Polypeptides of the invention are used for identifying specific modulators, potentially useful for regulating cellular pathways, e.g. to augment trilineage haematopolesis after cytoreductive therapy or to inhibit inflammation after hypoxia and reoxygenation injury (e.g. sepsis, trauma and adult respiratory distress syndrome). The present sequence is maize LPAAT

```
The present sequence represents a lysophosphatidic acid acetyltransferase (LPAAT) isoenzyme. The nucleic acid may be used to create transgenic plants which encode LPAAT at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. This would have the effect of altering the level of specific triacylglycerols in those cells, for e.g. overexpression of an LPAAT similar to the maize LPAAT will result in higher oil content in the seed, stem and leaf. LPAAT chimeric genes may be used for co-suppression of genes encoding LPAAT. The polynucleotides may also be used as probes for genetically and physically mapping the genes that are a part of, and as markers for traits linked to those genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid fragment encoding a lysophosphatidic acid acetyltransferase (LPAAT) isozyme, useful for creating transgenic plants which encode LPAAT at higher or lower levels than normal.

2000-558300/51. WPI; 2000-558300/9 N-PSDB; AAA64201.

New nucleic acid fragment encoding a lysophosphatidic acid acetyltransferase (LPAAT) isozyme, useful for creating transgenic plants which encode LPAAT at higher or lower levels than normal.

31; Page 101-102; 102pp; English Claim

The present sequence represents a lysophosphatidic acid acetyltransferase (LPAAT) isoenzyme. The nucleic acid may be used to create transgenic plants which encode LPAAT at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. 

This would have the effect of altering the level of specific triacylglycerols in those cells, for e.g. overexpression of an LPAAT similar to the maize LPAAT will result in higher oil content in the seed, stem and leaf. LPAAT chimeric genes may be used for co-suppression of genes encoding LPAAT. The polynucleotides may also be used as probes for genetically and physically mapping the genes that are a part of, and as markers for traits linked to those genes 5555555X8
